SRI SAI AI TUITIONS

Website User Experience, AI Assistant & Development Journey

PROJECT DOCUMENTATION

Prepared by Srinath Avula

https://sri-sai-ai-tuitions.hatchable.site/

GitHub source repository

End-user walkthrough • AI-assisted development • Manual interaction review

1. Project Overview

Sri Sai AI Tuitions is an education website intended to help parents and students understand the tuition service, explore learning benefits and fees, contact the provider, and request a free trial. It also includes an AI assistant named Greeshma, intended to provide conversational help with tuition-related questions and learning support.

The project combines a public information website with an assistant entry point. The user journey is designed to move from understanding the service, to checking plans, to asking a question or making an enquiry.

• Live application: https://sri-sai-ai-tuitions.hatchable.site/

• GitHub repository: https://github.com/Srinathavula/Sri-Sai-AI-Tuitions-Web

• Main visitor goals: learn about the tuition service, compare plans, ask questions, and request a trial or contact.

2. What a Visitor Does: End-User Journey

Step	Visitor action	What the interface is intended to do
1. Discover	Open the website and read the main headline and introduction.	Explain the service and surface the free-trial action early.
2. Explore	Use navigation links for learning approach, fees/plans, and benefits.	Move the visitor to relevant information.
3. Compare	Review Individual Plan and Sibling Offer cards.	Make options easier to compare.
4. Ask for help	Open Greeshma and ask a tuition or learning question.	Provide conversational help with subjects, homework, practice, study plans, admissions, classes, and fees.
5. Contact	Use phone, email, WhatsApp, or enquiry form.	Offer several contact paths.
6. Request a trial	Complete the enquiry form and submit.	Collect follow-up details; delivery depends on the configured form integration.

This describes the intended user journey. A successful message delivery or AI response should be claimed only for behavior actually observed in the live application.

3. UI/UX: Why the Sections and Controls Are Placed This Way

UI area	Placement / role	Usability benefit
Top navigation	Key sections and trial booking link at the top.	Quick access to important information.
Hero / first screen	Headline, short explanation, and free-trial CTA early.	Visitors quickly understand the service and next step.
Learning approach and benefits	Scan-friendly sections/cards.	Easier to skim than a dense paragraph.
Pricing cards	Individual and sibling options in separate cards.	Supports plan comparison.
Contact options	Phone/WhatsApp/email and enquiry form.	Supports different contact preferences.
Greeshma AI assistant	Additional help channel.	Visitors can ask questions conversationally.
Form fields	Parent/guardian, student, class/grade, city, phone, optional notes.	Collects practical enquiry details.

Good usability means each control communicates what it does, is easy to find, responds clearly, and avoids surprising navigation. Mobile layout and touch-target behavior should be checked at real viewport sizes.

4. Greeshma — AI Assistant Added to the Website

Greeshma is the AI assistant associated with Sri Sai AI Tuitions. Its intended role is to help students and parents with common tuition and learning questions through a conversational interface. Project context describes an embedded ElevenLabs agent widget; the assistant is a feature separate from the static website content.

• Learning help: explain subject concepts and help work through homework or problems.

• Practice: provide practice questions, quizzes, and revision support.

• Study planning: help with study plans and exam preparation.

• Tuition information: answer general questions about admissions, classes, fees, and learning support.

• Language support: English, Telugu, and Tanglish are intended communication styles based on the assistant configuration context.

Typical use: open the assistant, ask a specific question, read or listen to the response depending on widget mode, and ask a follow-up if needed. If it does not understand, it should clarify or state its limitation rather than inventing policies or fees.

Example questions: “What subjects can I get help with?”, “Can you help me prepare for an exam?”, “What are the tuition fees?”, and “How can I request a free trial?” These are example inputs, not proof that every response has been validated.

For a complete feature description, use the live assistant and record whether chat, voice, language switching, follow-up context, and fallback behavior work as expected.

5. Contact Form and Formspree

Earlier project context records a Formspree endpoint: https://formspree.io/f/mvgdywvj. The previously described visitor flow was that a form submission could be handled by Formspree and then open WhatsApp. The current live configuration should be confirmed before presenting this as the active production flow.

1. Visitor enters requested contact details and an optional message.

2. The form should validate required fields and reject invalid values before submission.

3. On success, the interface should show a clear confirmation and next step.

4. On failure, it should show an error and retain entered information where practical.

5. If WhatsApp opens after submission, the message should be correctly formatted and the visitor should understand they may still need to press Send.

Confirm delivery with a genuine test enquiry before marking the flow as successful. Avoid using real student details during demonstrations.

6. How ChatGPT Was Used: Prompt-to-Improvement Workflow

The practical workflow is to describe the desired result, generate or modify implementation, open the result as a visitor, notice mismatches, and ask for focused corrections. Exact historical prompts were not supplied; examples below are representative, not verbatim records.

Initial build prompt

> *"Build a clean, responsive website for Sri Sai AI Tuitions. Include a clear hero section, learning approach, benefits, pricing plans, free-trial enquiry form, contact options, and an accessible AI assistant entry point. Prioritise readability and a simple visitor journey."*

Improve the UI

> *"Review the website as a first-time parent on a phone. Improve spacing, typography, section hierarchy, button visibility, pricing-card consistency, and content order. Keep the free-trial action easy to find. Do not remove working links or the assistant."*

Improve the assistant entry point

> *"Make the assistant easy to discover without covering important content. Use a clear label and usable open/close behavior. Ensure visitors can return to browsing after using it."*

Fix a specific issue

> *"Change only the described issue. Preserve existing sections, pricing, navigation, form behavior, contact links, and assistant integration. Explain the change and list what a visitor should manually try afterward."*

Compare versions

> *"Compare the earlier GitHub-hosted website with the current version using supplied screenshots and repository history. List only observable changes and separate design, functionality, and deployment changes."*

7. Before vs. After and Deployment Story

The current public website is https://sri-sai-ai-tuitions.hatchable.site/ and the repository is https://github.com/Srinathavula/Sri-Sai-AI-Tuitions-Web. Project history indicates an earlier GitHub-hosted version before work continued in Hatchable. The earlier screenshot and verified old URL were not supplied, so visual differences cannot be asserted conclusively.

Aspect	Earlier stage	Current stage / evidence
Hosting	User reports an earlier GitHub-hosted version.	Current shared live URL is hosted on Hatchable.
Source control	Project source hosted in GitHub.	Public repository remains available.
UI	Original screenshot not supplied for direct comparison.	Current site has tuition information, benefits, plans, contact/enquiry, and an assistant entry point.
AI assistant	Earlier-version presence not confirmed here.	Project context records Greeshma as the embedded assistant.
Form flow	Historical context records Formspree and WhatsApp follow-up.	Current form endpoint and behavior need confirmation.
Deployment automation	Exact migration/automation not established.	Do not assume automatic GitHub-to-hosting deployment without configuration evidence.

1. Create or refine the site with AI-assisted prompts and inspect the output.

2. Keep source changes in GitHub for version history.

3. Publish through the configured hosting environment.

4. Open the public URL and inspect sections, links, form, and assistant entry point.

5. After each significant change, revisit the affected user journey.

8. Manual End-User Testing: How It Feels to Use the App

This is a manual user-perspective walkthrough, not an automated test report. No Selenium, Cypress, Playwright, Postman, or other automated testing tool is assumed. Record outcomes from the actual live session; do not mark a case passed just because a control is visible.

Scenario	User action	Expected behavior	Status guidance
Open site	Open live URL in a fresh tab.	Page loads and main content is readable.	Content observed; full cross-browser test not established.
Navigate	Click each navigation link.	Relevant section/destination opens.	Try each link.
Free trial	Click main trial CTA.	Enquiry form/section opens.	Verify manually.
Compare plans	Read pricing and click a plan CTA.	Plan details are clear and next action is correct.	Verify manually.
Open Greeshma	Open assistant entry point.	Assistant appears without blocking the site.	Verify live.
Ask a question	Ask what tuition help is available.	Relevant, clear response.	Record actual response.
Follow-up	Ask a related second question.	Assistant retains useful context.	Record actual response.
Telugu/Tanglish	Ask a tuition question in Telugu/Tanglish.	Appropriate response or clear limitation.	Verify manually.
Unknown detail	Ask for a policy/fee not in knowledge.	Assistant does not invent details.	Verify actual response.
Valid enquiry	Fill required fields with test data and submit.	Truthful confirmation and delivery to configured destination.	Confirm delivery.
Incomplete form	Leave required field empty.	Clear validation message.	Verify manually.
Invalid phone	Enter invalid phone value.	Rejected or clearly flagged according to validation rules.	Verify actual rules.
Network failure	Use a controlled failure scenario if safe.	No false success; useful error shown.	Requires deliberate test.
Contact links	Open WhatsApp/email.	Correct destination opens.	Try each link.
Mobile view	Use narrow viewport or phone.	No unwanted overflow; controls remain usable.	Verify device/viewport.
Return from assistant	Close/minimise assistant.	Continue browsing normally.	Verify manually.

Record date, browser/device, action, observed result, expected result, issue, change made, and result after the change. This demonstrates hands-on use without implying automated testing.

9. Known Limitations and Next Improvements

• Confirm the current Formspree configuration and verify where a test enquiry is delivered.

• Verify Greeshma's chat/voice mode, languages, follow-up context, and fallback responses.

• Capture the old GitHub-hosted page and current page at the same viewport for a fair before/after comparison.

• Check that the assistant launcher does not overlap the trial CTA, form, or contact buttons on mobile.

• Review keyboard use, labels, focus visibility, contrast, and motion behavior.

• Document the real source-to-deployment process only after checking hosting settings.

10. Summary

Sri Sai AI Tuitions combines an education landing page, pricing and enquiry flow, contact options, and the Greeshma AI assistant. The most meaningful validation is to use the application as a parent or student would: browse sections, compare plans, ask the assistant questions, use contact routes, and submit a test enquiry. This document prioritises the real user journey and separates visible features from behavior requiring confirmation.

Sri Sai AI Tuitions — Screenshot-Based UI Review

Supplement to the project documentation. This review is based on the full-page screenshot supplied on 29 October 2026.

Header and navigation

The brand sits at the upper left. Navigation links for Our approach, Fees & plans, and Why us appear across the upper area, with a high-contrast Book a free trial button at the right. This keeps the main action easy to discover while providing shortcuts to page sections.

Hero section

The main headline, “Help your child learn with confidence,” appears on the left with a short supporting description, a primary Book a free trial button, and a secondary Explore our plans button. A tuition/AI illustration occupies the right side. This balances explanation and action in the first viewport.

Quick value cues

A narrow row beneath the hero highlights personalised lessons, regular practice, progress updates, and AI-supported learning. These concise items let a visitor scan the key benefits before reading the longer sections.

Learning-benefit cards

Four cards present Personal attention, Clear explanations, Practice with purpose, and AI-supported tools. Icons, short descriptions, and consistent card layouts make the information easier to scan.

Pricing section

Two plan cards compare an Individual Plan at ■2,500/month and a Sibling Offer at ■2,000 per student/month for two students from the same family. Each card lists inclusions and provides a trial/booking action. This is a clear comparison pattern, though each CTA should be clicked to verify its destination.

Learning approach section

An illustration sits alongside a heading and a short list describing understanding before memorising, making practice a habit, keeping parents informed, and starting without pressure. The alternating image/text layout helps break up the page.

Free-trial callout

A distinct full-width band repeats the one-week trial offer and provides another Book a free trial action. Repeating the primary CTA after the value and pricing sections supports visitors who need more information before deciding.

Enquiry and contact section

The lower page places contact details and WhatsApp information on the left and a Request your free trial form on the right. Visible fields include parent/guardian name, child's name, class/grade dropdown, city, contact phone, and optional notes.

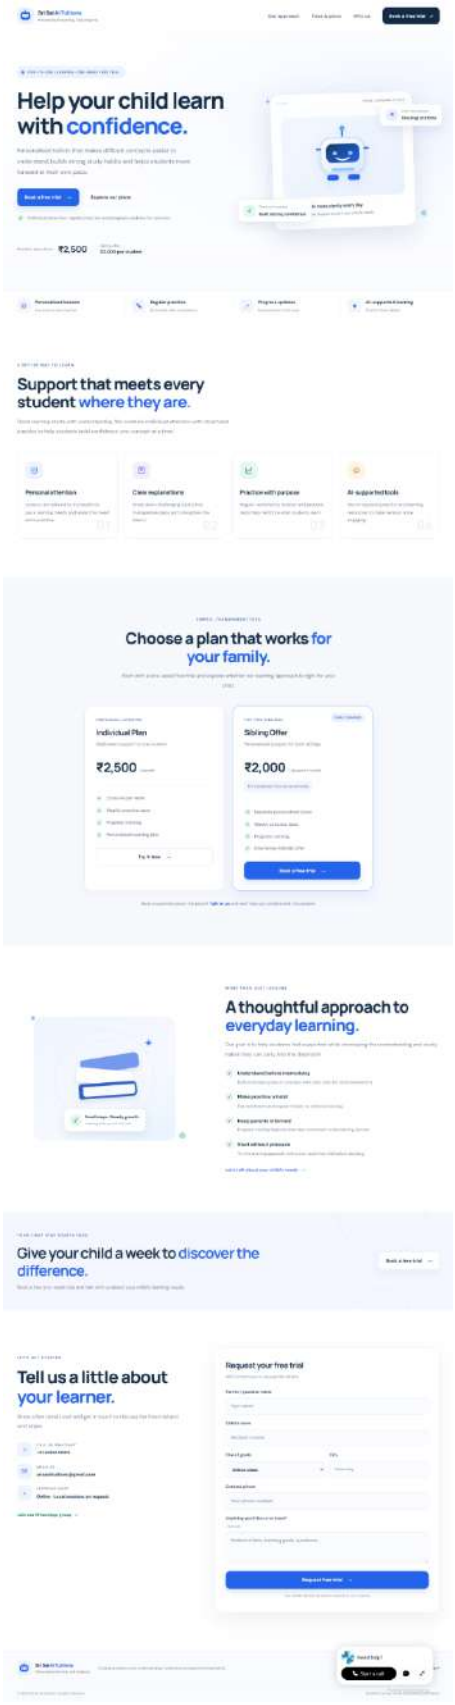

Floating assistant

A compact help widget is visible near the bottom-right corner with “Need help?” and “Start a call,” alongside smaller controls. This makes the assistant discoverable without placing it in the main navigation. Its open/call behavior needs direct interaction verification.

Footer

The footer repeats the brand and includes copyright text and hosting attribution. This provides a clear page ending and reinforces the site identity.

Figure 1. Full-page screenshot supplied by the project owner. Visible design is documented; actual interaction success still requires direct use.

Evidence note: screenshot proves the visible page composition and text, not successful form delivery, dropdown behavior, or assistant call completion.

12. Before-and-After Comparison: GitHub Pages and Hatchable

This comparison uses the two supplied full-page screenshots and public URLs. It describes visible differences only and does not assume hidden code changes or automated deployment.

Area	Earlier GitHub Pages screenshot	Later Hatchable screenshot	Observed difference
Header/navigation	Brand at upper left; Features, Pricing, Enroll Now at upper right.	Brand at upper left; Our approach, Fees & plans, Why us, Book a free trial.	Navigation labels are more descriptive of page sections; the CTA wording is more explicit.
Hero message	Longer headline focused on AI-powered personalised learning, scores, and confidence.	Shorter, more direct headline: “Help your child learn with confidence.”	The later headline is more concise and easier to scan.
Hero layout	Text and call-to-action on left; a tutor illustration card on right.	Text and CTAs on left; a larger AI/learning illustration on right.	Both use a two-column hero; the later screenshot has more visual whitespace and a clearer CTA hierarchy.
Benefit summary	Four cards: AI-Powered, Personalized, Exam Prep, Progress Tracking.	A slim value strip followed by four detailed cards: Personal attention, Clear explanations, Practice with purpose, AI-supported tools.	Later page adds more explanation of the benefit rather than relying only on labels.
Pricing	Two wide cards for Individual Plan and Sibling Offer.	Two more detailed pricing cards with inclusions, CTA buttons, and a more prominent sibling offer badge.	Later version makes next actions and plan details more visible.
Learning approach / why choose us	A compact “Why Sri Sai AI Tuitions?” list of benefits.	Dedicated learning-approach section, trial callout, and a structured list of teaching principles.	Content is split into more distinct sections, improving visual hierarchy.
Testimonials	Three testimonial cards with named initials and quotes.	No testimonial cards visible in the supplied later screenshot; instead, the page emphasizes the approach and trial journey.	Content emphasis changed; do not infer that testimonials were deleted from the site unless confirmed from the live page.
Enquiry form	Enrol / Contact form near the bottom, with parent/student, grade, city, phone, and a request button.	A dedicated free-trial form section with parent/guardian, child, grade dropdown, city, phone, and optional notes.	The later screenshot gives the form more space and includes an optional message field.
Contact details	Quick Contact card includes phone, email, WhatsApp group, location, Request Call Back, and View Plans.	Contact details are presented alongside the form; current screenshot includes a floating “Need help?” assistant widget with “Start a call.”	The later screenshot visibly adds a floating assistant/call entry point; actual call completion still needs a live interaction check.
Footer	Copyright line at the bottom.	Brand footer, copyright, and hosting attribution are visible.	Footer presentation differs; functional significance is not established by screenshots alone.
Hosting / deployment	URL is on GitHub Pages.	URL is on Hatchable.	The published URL changed. This alone does not prove how code was transferred or whether deployment is automatic.

What the screenshots prove — and what they do not

• They prove visible content, section order, labels, prices, and control placement at screenshot time.

• They support visual comparison of the earlier GitHub Pages page and the later Hatchable page.

• They do not prove successful button clicks, dropdown selection, form delivery, WhatsApp behavior, or assistant calls.

• They do not establish the exact source changes, historical prompts, or automatic GitHub-to-Hatchable deployment.

• The earlier screenshot shows a “Sri Sai AI Tutor GPT” illustration/card but no visibly operating assistant widget. The later screenshot shows a floating “Need help?” / “Start a call” widget. That is a visible difference, not proof of a completed AI conversation or call.

Figure 2. Earlier GitHub Pages Version
